

From Support Feedback to Self-Service Knowledge

Redesigning the FAQ experience for a corporate banking platform based on 1,345 user feedback entries

Project type	Product Design - UX Research - Information Architecture - Enterprise Banking
Product	BAM Sazmani - corporate banking platform
My role	UX/Product Designer
Dataset	1,345 feedback entries, 902 unique organization/user IDs
Date range	Aug 2020 - Oct 2025

Portfolio summary

I analyzed 1,345 real user feedback entries from a corporate banking platform and found that many support requests were not caused by technical failure, but by preventable knowledge gaps. By identifying high-volume recurring topics, separating FAQ-addressable questions from support-required issues, and restructuring the FAQ around user intent, we redesigned the help experience into a searchable self-service knowledge layer for enterprise banking users.

Key data point: the top 5 feedback categories covered 72.1% of all entries.

1. Context

BAM Sazmani is a web-based corporate banking platform used by organizational users to manage financial operations such as transfers, account access, checks, reports, user permissions, and organizational banking tasks.

After users migrated from the older corporate banking system to the newer platform, many of them were still learning how to complete common tasks or find the right information. As a result, the feedback/support channel became overloaded with repeated questions.

The existing FAQ was limited, outdated, not searchable enough, and not organized around how users actually described their problems.

2. Problem

The support channel had accumulated 1,345 feedback entries between Aug 2020 and Oct 2025, submitted by 902 unique organization/user IDs.

When we reviewed the feedback, we found that many requests were not purely technical issues. A large portion of them were repeated questions around checks, transfers, account visibility, basic organizational information, user access, reports, petty cash cards, batch payments, and payroll.

Users were often using support for questions that could have been answered earlier through a clearer self-service help experience.

The core problem was not only that the FAQ was old. The deeper problem was that users were dependent on support because knowledge was not discoverable, searchable, or structured around their real needs.

3. Data Snapshot

Metric	Value
Total feedback entries	1,345
Unique organization/user IDs	902
Date range	Aug 2020 - Oct 2025
Number of feedback categories	14
Share of top 5 categories	72.1%

Rank	Category	Count	Share
1	Checks / Sayad	277	20.6%
2	Other / General Guidance	250	18.6%
3	Transfers	166	12.3%
4	Accounts / Statements	161	12.0%
5	Basic Information	116	8.6%
6	General Feedback	86	6.4%
7	Batch Transfer	73	5.4%
8	User Access	59	4.4%
9	Reports	58	4.3%
10	Bills	31	2.3%
11	Group Payments	27	2.0%
12	Dashboard	20	1.5%
13	Payroll	14	1.0%
14	Analytics Reports	7	0.5%

4. Feedback Category Volume

This chart shows the concentration of feedback across the 14 categories. It supports the prioritization argument: a small number of categories carried most of the support load.

Insight: the top 5 categories account for 72.1% of all feedback entries, making them the highest-priority candidates for FAQ restructuring and content coverage.

5. Research Approach

I treated support feedback as a UX research source, not only as a support backlog. The analysis had three layers:

- Frequency analysis - Which topics appeared most often?
- Intent analysis - What was the user actually trying to do?
- Triage analysis - Should this become FAQ content, a product improvement, or remain a support-required issue?

Feedback triage model

Type	Meaning	Example
FAQ-addressable	Repeated questions with stable answers	How can I register a Sayad check?
Support-required	Technical, account-specific, or operational issues	A specific transfer failed or an account is missing.
Product improvement signal	Feedback pointing to confusing flows, missing features, or unclear UX	Users repeatedly cannot find where to manage access.

6. Key Insight

The support channel was carrying two different loads at the same time: real support issues and preventable knowledge gaps.

Users were not always blocked because the system was broken. Many were blocked because the answer was not easy to find, not searchable, or not written in the language they used. So the opportunity was not simply to add more FAQ items. The real opportunity was to redesign FAQ as a self-service support layer.

7. Design Goal

The goal was to reduce unnecessary support dependency by helping users find reliable answers before submitting feedback or contacting support.

The redesigned FAQ needed to:

- organize content around user tasks
- support search through keywords and alternative phrasings
- cover high-frequency support topics first
- separate guidance questions from technical issues
- help users understand when they can solve something themselves and when they need support
- create a measurable foundation for post-launch improvement

8. Solution

We redesigned the FAQ from a static list of questions into a structured knowledge experience. Instead of organizing content only around internal product modules, we used real feedback patterns to define user-facing categories.

The new FAQ structure focused on high-volume topics such as checks and Sayad check operations, transfers, account visibility and statements, basic organization information, user access and permissions, reports, batch payments, and petty cash cards.

Each FAQ item could include keywords based on the language users used in their feedback, making search more tolerant of different phrasings.

9. Design Decisions

Decision 1 - FAQ before chatbot

A chatbot could have looked more advanced, but it was not the right first step. The feedback showed many repeated questions with stable answers. A structured FAQ was lower-risk, easier to maintain, and created a clean knowledge base before investing in automation.

Decision 2 - User language over internal taxonomy

The original categorization was useful for analysis, but not always enough for user-facing navigation. Users did not always think in product module names. They described problems like: 'My account is not visible', 'I cannot register a Sayad check', or 'How can I access petty cash card services?'

Decision 3 - Search plus categories

Some users know exactly what they are looking for. Others need to browse. So the redesigned experience needed both category-based navigation and keyword-based search.

Senior-level critique

The 'Other / General Guidance' category had 250 entries, making it the second-largest category. From a senior design perspective, this is a signal that the original taxonomy was not enough for decision-making. This became part of the design rationale: introduce a second layer of intent-based tagging to separate guidance questions, product issues, and support-required cases.

10. Measurement Plan

Because the redesigned FAQ had not yet been launched to production, we should not claim final impact. Instead, the case study should frame impact honestly as a measurement framework ready for post-launch validation.

Metric	Why it matters
Reduction in repeated FAQ-addressable feedback	Shows whether self-service reduced support dependency.
FAQ search usage	Shows whether users are using the help experience.
Search terms with no result	Reveals missing content.
Click-through rate on FAQ results	Shows whether search results are relevant.
Support tickets for top categories	Measures operational impact.
Was this helpful? response	Measures content usefulness.

11. Outcome

The project transformed scattered support feedback into a structured self-service knowledge layer. Instead of treating feedback only as support noise, we used it as a design input to understand where users repeatedly needed guidance.

The work created:

- a clearer understanding of recurring user problems
- a prioritized FAQ content backlog
- a user-intent-based structure for help content
- a keyword strategy for search
- a measurement plan for post-launch validation

12. Recommended Portfolio Visuals

To make this case study feel senior and not like a simple content update, the page should show the transformation from raw feedback to structured product knowledge.

Visual	Purpose
Feedback category chart	Show volume and prioritization.
Top 5 insight card	Show that top 5 categories cover 72.1% of all entries.
Feedback triage model	Show how you separated FAQ, support, and product issues.
Before / After FAQ structure	Show the move from limited FAQ to task-based knowledge structure.
Raw feedback to FAQ article	Show the design reasoning from real user language to content strategy.

Example transformation

Raw feedback	User intent	FAQ article
My account number is not visible. What should I do?	Understand why an account is hidden	Why are some accounts not visible in BAM Sazmani?

Final title recommendation
